4	2320030395	KATKURI ABHINAV GOUD
Name of the Guide		Dr Gudikandhula Kalpana

Abstract

The **Dynamic Crime Graph Analytics and Web Intelligence System** is a data-driven analytical framework designed to identify, analyze, and visualize complex relationships among criminal incidents, locations, crime types, individuals, and time-based patterns. Traditional crime analysis systems generally treat incidents as independent records, making it difficult to discover hidden relationships and understand how criminal activities evolve over time. This project addresses this limitation by integrating **graph analytics, Big Data processing, machine learning, spatial analysis, and web intelligence** into a unified system.The proposed system represents crime-related information as a **dynamic graph**, where nodes represent entities such as locations, crime categories, incidents, suspects, and organizations, while edges represent relationships between these entities. Graph-based techniques are used to identify highly connected locations, recurring crime associations, clusters, influential nodes, and emerging patterns. The dynamic nature of the graph enables the system to analyze how crime relationships change across different time periods.The system also incorporates **web intelligence** to collect and analyze relevant information from publicly available online sources such as news articles, government publications, and other legally accessible web data. **Natural Language Processing (NLP)** techniques can be used to extract crime-related entities, locations, dates, keywords, and events from unstructured textual data. These extracted entities can subsequently be integrated into the crime graph to enrich the analytical network.
